GA4 | Product Conversion Overview

Historical GA4 e-commerce sample | January 25–31, 2021

Total Sessions	Pseudonymous Users	Product-View Sessions	Sequential Purchasing Sessions	Sequential Session Purchase Rate
26,355	21,596	6,192	226	0.86%

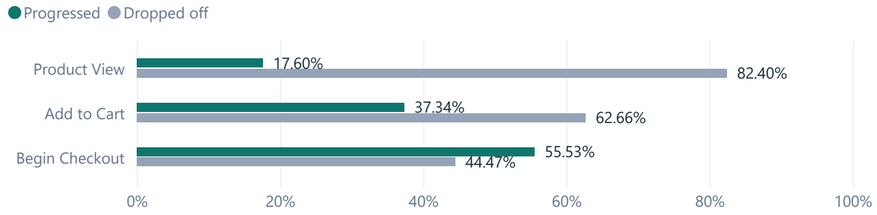

Sequential purchase funnel

Sessions, Progression to next stage and Sessions lost before next stage by Stage

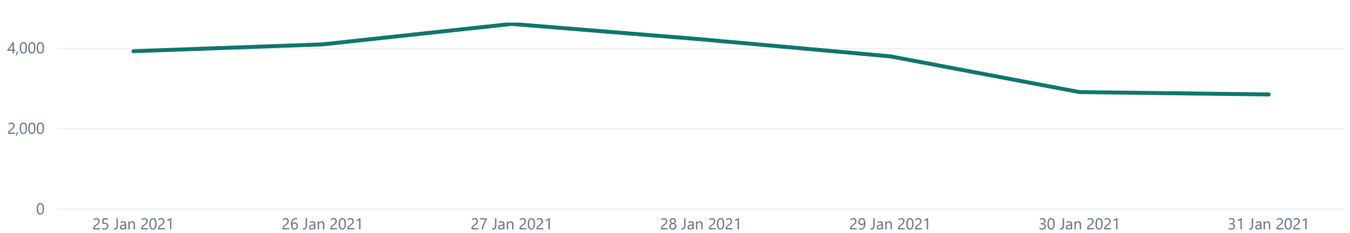

Stage conversion and drop-off

Progressed, Dropped off and Sessions dropped off by Starting stage

Daily observed sessions | UTC session-start date

Sessions, Pseudonymous users and Observed events by UTC session-start date

Sessions lost before the next stage

After view	After cart	After checkout
5,102	683	181

Business interpretation

Product view to cart has the largest observed within-funnel loss in the validated seven-day sample.

Stage rates use the preceding qualifying stage as the denominator. Overall purchase rate includes all sessions, including non-entrants.

Observed differences do not establish causes. Equal timestamps can qualify together; boundary sessions may be incomplete. Product continuity is not enforced.

Historical, obfuscated observations | Sequential sessions, not event counts | UTC session dates differ from GA4 property-local event dates

GA4 | Device & Acquisition Performance

Historical GA4 e-commerce sample | January 25–31, 2021

Device: All

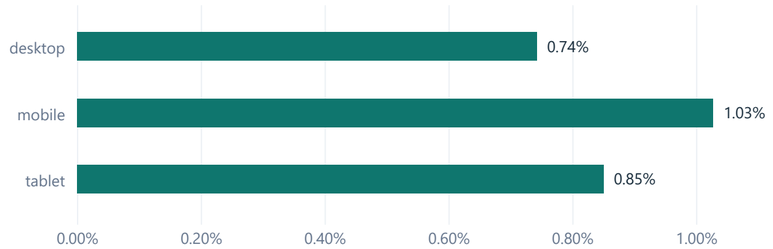

Custom attributed channel: All

UTC session-start date: All

Desktop purchase rate	Mobile purchase rate	Tablet purchase rate	Observed device gap · percentage points
0.74%	1.03%	0.85%	0.29 pp

Purchase rate by device

Sequential purchasing sessions / all sessions by device

Sequential funnel by device

Device	Sessions	Product-view sessions	Add-to-cart sessions	Checkout sessions	Sequential purchasing sessions	Session purchase rate
desktop	15,354	3,592	626	221	114	0.74%
mobile	10,413	2,457	441	174	107	1.03%
tablet	588	143	23	12	5	0.85%
Total	26,355	6,192	1,090	407	226	0.86%

Custom channel performance

Custom attributed channel	Sessions	Sequential purchasing sessions	Session purchase rate	View-to-cart rate
Organic Search	11,067	65	0.59%	12.32%
Unknown	7,582	0	0.00%	2.50%
Internal Referral Only	4,045	87	2.15%	28.95%
Referral	2,706	57	2.11%	31.37%
Other	664	5	0.75%	14.75%
Total	26,355	226	0.86%	17.60%

Interpretation & limitations

Compare purchase rates with session counts. Small device or channel segments can produce unstable observed rates.

Channels use a custom session-attribution proxy, not official GA4 channel grouping or verified acquisition. Unknown and Internal Referral Only are included.

Gap = highest minus lowest selected device rate; blank for fewer than two devices. Investigate audience mix and attribution quality. No causal or significance claim.

GA4 | Attribution & Data Quality

Historical GA4 e-commerce sample | January 25-31, 2021

Device: All

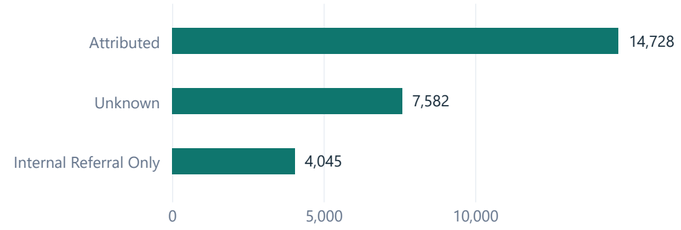

Custom attributed channel: All

UTC session-start date: All

Total sessions	Attributed session share	Unknown attribution share	Internal-referral session share	Conflicting-source session share
26,355	55.88%	28.77%	30.51%	15.94%

Attribution status

Session counts - mutually exclusive categories

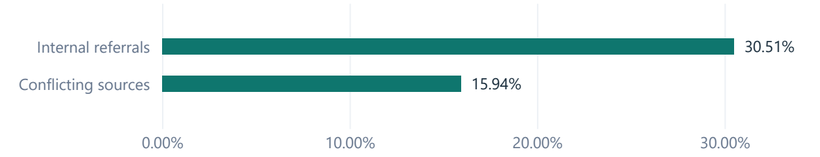

Attribution coverage by status

Attribution status	Sessions	Selected sessions %
Attributed	14,728	55.88%
Unknown	7,582	28.77%
Internal Referral Only	4,045	15.35%
Total	26,355	100.00%

Attribution quality flags

Each rate uses all selected sessions

Flags overlap; do not add them. Conflicting = more than one source/medium pair.

Channel quality - rates within each channel

Custom attributed channel	Sessions	Internal-referral sessions	Internal-referral %	Conflicting-source sessions	Conflicting-source %	Unknown sessions
Organic Search	11,067	2,801	25.31%	2,844	25.70%	0
Unknown	7,582	0	0.00%	0	0.00%	7,582
Internal Referral Only	4,045	4,045	100.00%	124	3.07%	0
Referral	2,706	948	35.03%	980	36.22%	0
Other	664	144	21.69%	147	22.14%	0
Direct	165	43	26.06%	44	26.67%	0
Email	108	56	51.85%	57	52.78%	0
Total	26,355	8,041	30.51%	4,200	15.94%	7,582

Interpretation & limitations

Store referrals can replace the apparent acquisition source. The proxy uses the first non-internal source/medium pair.

Multiple pairs within a session flag conflicting information; they do not identify its cause.

Uncertain attribution can distort channel conversion comparisons. Check tagging and referral handling before allocating marketing spend.

Custom session attribution is not official GA4 attribution or default channel grouping. Observed associations do not establish causality.
